Step 1: Open a terminal

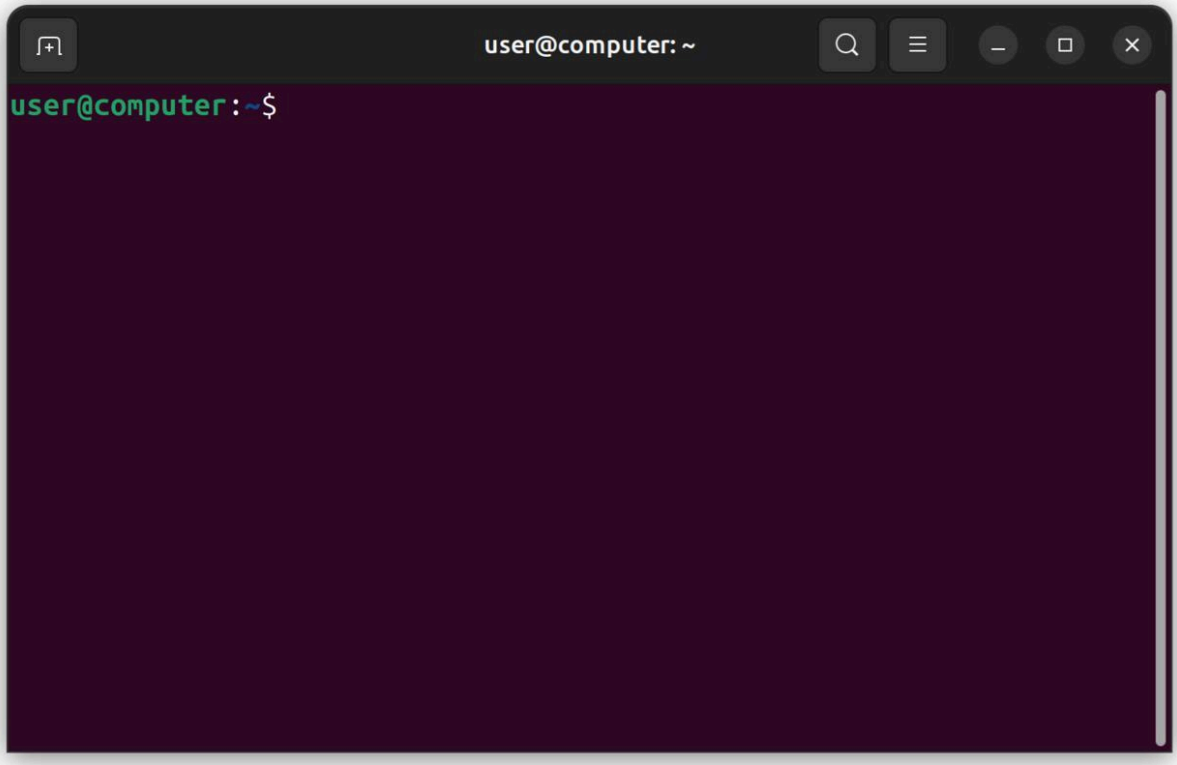

Windows

Open the Start menu and launch Anaconda Prompt.

macOS (sometimes called iOS by mistake)

Open Applications → Utilities → Terminal. This includes both Intel Macs and Apple Silicon Macs (M1/M2/M3/M4 and newer).

Linux

Open your Terminal application.

Run the commands below in the terminal, not in a Python code cell. If a command starts with `!`, that is generally Jupyter notebook syntax rather than terminal syntax.

Step 2: Create a new environment

We will call the environment `flasktorch` and use Python 3.11 for a broadly compatible teaching setup.

conda create -n flasktorch python=3.11 -y

Step 3: Activate the environment

conda activate flasktorch

Step 4: Install Flask, PyTorch, and Jupyter support

With `(flasktorch)` activated, run:

python -m pip install --upgrade pip
python -m pip install flask
python -m pip install torch torchvision torchaudio
python -m pip install ipykernel
